# SCINTIFLEX

THE PAVEMENT THAT PLAYS WITH LIGHT

Scintiflex is an attractive urban pavement. It contains fragments of mirror that catch the light and sparkle beneath public lighting and vehicle headlights.

Scintiflex is ideal for shared mobility zones: it sharpens the vigilance of the different road users and clearly differentiates between different areas.

Its decorative qualities bring out the best in prestigious sites, architectural landmarks and tourist attractions.

Scintiflex becomes even more attractive when combined with a clear synthetic binder, or a plant-based binder, thanks to the resultant natural or dyed color.

Scintiflex's properties are comparable to those of traditional surfaces. It can be used for pedestrian traffic, soft mobility options and urban traffic.

## CONDITIONS

- thickness of 2.5 to 4 cm
- produced hot, warm or cold

## APPLICATIONS

- shared mobility areas
- downtown areas
- cycle tracks
- intersections
- noteworthy sites

## ADVANTAGES

- Safe urban mobility
- Showcases noteworthy sites
- Unusual and decorative
